Thank you for choosing one of our products. We hope that you enjoy the building process. Read the instructions and follow the directions. For any query or problem which may come up, you can contact DOMUS KITS<sup>®</sup>, S.L.

Our thanks to BRUGAL ARQUITECTES & ENGINYERS, S.C.P. for supplying the preliminary plans for developing the model.

-Assemble the parts of the wooden base with white glue. Arrange one of the two parts in a slope on top of the wedges provided. Cover the front with the rectangular piece.

-Cut the figures on the cardboard patterns along the perimeter. Fold the figures on the dotted lines using a cutter and a ruler to mark the edges.

-Cut out the black sections and cover them on the back with the PVC sheets provided, cut out according to the openings. Stick them on using adhesive paper or special glue for plastics.

-Glue the flanges marked on the patterns in the reserved area of the wooden base. Then, join them to form the cardboard structure. Remember that sometimes the flanges are narrow for the wide surface to be supported. Therefore, the glue supplied (white wood glue) can be replaced by stronger glues. We recommend that you plan for this by also having available additional instruments such as rubber bands, clips, clothespins, weights, etc. to secure the structure while the glue dries.

-Use the glue to attach the ceramic parts in the area between the line outside of the perimeter of the facades and the cardboard structure. The lines of the doors and windows should be respected.

-Except for these minor exceptions, generally the ceramic parts used to build the walls should be added spontaneously, without prior selection by size (either large or small can be used, only ensuring that the lines are the same height). The parts can be adjusted to one another with sandpaper so that they fill the required space or position.

-Tile the terrace floor with the 0.6x5 strip.

-Paint and fit the 5x5 and 5x10 beams on the relevant walls.

-Cut out and fit the 1x3 strips in their relevant positions around the doors and windows.

-Glue the overhanging section of the first floor and its balcony (on top of the 18 x 68 piece).

-Tile the entrance to the house (at the same level as the stone façade) and the overhanging section with the 2x10 strip.

-Glue the 17x132 section over the terrace as a porch. Do the same with the 2x10 strip over the entrance to the house.

-Paint the flat roofs with white glue and stick the sand onto it.

-Paint the exposed parts of cardboard on the façade.

-Fit the railings with strips of PVC sheet, topped with the 1x3 strip.

-Paint the swimming pool area and arrange a PVC sheet on top.

-Pave the area around the pool with 0.6x5 strip.

-Construct the staircase and path leading to the house with the 1x3 strip.

-Cut two fragments from the polystyrene lid of the box with a cutter and shape them into cones. Cover with glue and stick on the dark flock provided. Stick them wherever you wish to represent cypress trees.

During the entire process we recommend that you follow the sequence of photographs provided as an example.

Finally, cover the wooden board with white glue and sprinkle the "flock" on it until it is attached. Use the moss to decorate the floor, combined with earthy and grey paint. After this decorative part of the assembly has been completed, the model should have a finished appearance. Therefore, we encourage you to decorate it according to your individual preferences.

DOMUS KITS<sup>®</sup>, S.L. hopes to have provided an enjoyable pastime with the assembly of this model.
